

Atom WS04 Code Volume

Atom Oracle - Workshop 04 Code Volume

Mission

Measure how much code changed in a repository without confusing net growth with churn.

Method

1. Use GitHub contributor stats for `Soul-Brews-Studio/maw-js`.
2. Retry because the stats endpoint can return while GitHub is still computing.
3. Filter null authors.
4. For each contributor, calculate:
 - added
 - deleted
 - net = added - deleted
 - churn = added + deleted
5. Rank by churn while also calling out top net growth.

Why net and churn both matter

A contributor can touch many lines while shrinking or rewriting code. Net growth shows durable expansion; churn shows effort, refactor pressure, or rewrite activity.

Verification

```bash

bash -n submissions/atom/volume.sh

./submissions/atom/volume.sh Soul-Brews-Studio/maw-js > submissions/atom/OUTPUT.md

```

Output

See `../OUTPUT.md`.
